

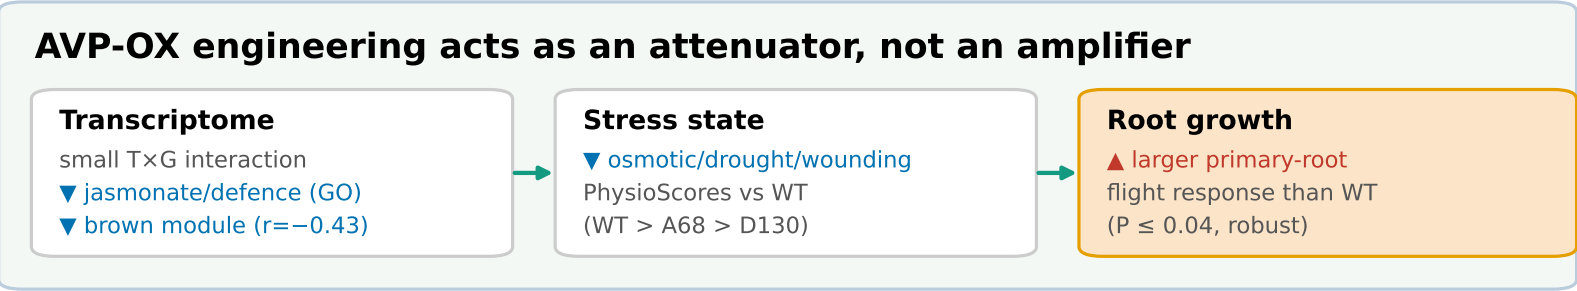

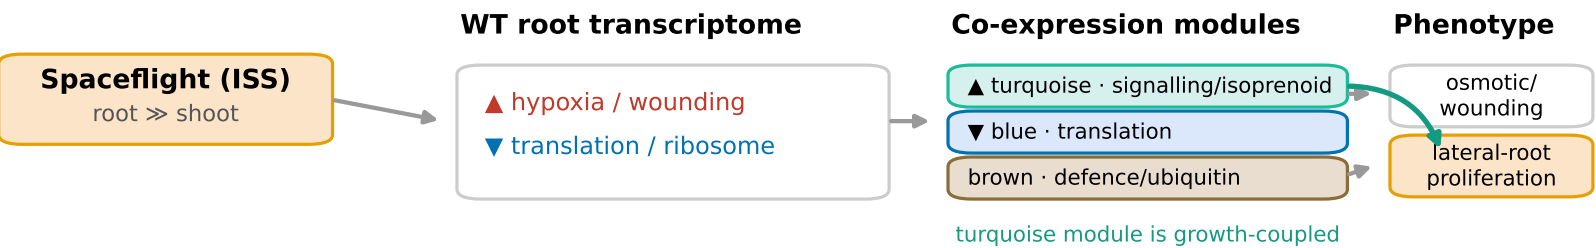

Fig 7. Integrative model — AVP-OX cotton: less stress, more root

Caveats: RNA-seq unpaired to imaged plants → integration group-level (n=6), Flight/growth collinear (correlational); root-growth magnitude pending FL/GC image-scale calibration. Candidate mechanism: isoprenoid → growth-hormone precursors.

Implication: stress-tolerance engineering (AVP1-OX) yields a calmer-yet-more-vigorous root phenotype for space agriculture.
